1. Description

The session tasks provide a convenient programmatic interface to manipulating key/value pairs. These tasks also facilitate sharing data across commands within a module.

General usage:

```
<session-getinstance session="my.session"/>
<session-put session="my.session" key="key1" value="value1"/>
<session-put session="my.session" key="key2" value="value2"/>
<session-get session="my.session" key="key1"
resultproperty="get.result"/>
<session-remove session="my.session" key="key2" />
<session-store session="my.session" file="my.session" />
```
